Title: Perfect score: Sequence:

1 MQVDETLIPRKVPSLCSARY......LIFGEADVQEWAKERKLTRL 401

Scoring table: OLIGO Gapop 60.0 , Gapext 60.0

Searched: 188963 seqs, 23686106 residues

Word size : 0

Total number of hits satisfying chosen parameters:

188963

Minimum DB seq length: 0
Maximum DB seq length: 1000000

Post-processing: Listing first 45 summaries

Database : A_Geneseq_36:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                    The present invention describes hereditary haemochromatosis gene CC products from the human haemochromatosis gene. Also described is a CC method to determine the presence or absence of the common hereditary cCC haemochromatosis (HFE) gene mutation in an individual comprising: CC presence or absence of the presence or absence of a haplotype or genotype where CC the presence or absence of the haplotype genotype indicates the likely creamed an acceptable of the HFE gene mutation in the genome of the individual. The CC presence of the HFE gene mutation in the genome of the individual. The CC presence sequences from the present invention can be used to develop counts for use in the diagnosis and treatment of HFE. The present cc invention also describes BTF genes, which are homologues of the milk CC protein butyrophilin (BT), and can be used in the production of agonists considered are: (1) a RoRet gene CC which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NFT3 and NFT4 genes which are homologues of a type 1 sodium transport gene, and can cc similarly be used for hypophosphatemia. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Q

OF GENERAL RESTRICTION OF STATES AND SOURCE 
                                   The present invention describes hereditary haemochromatosis gene comethod to determine the presence or absence of the common hereditary comethod to determine the presence or absence of the common hereditary comethod to determine the presence or absence of the presence or genotype the common hereditary comethod to determine the presence or absence of the presence of the presence of the presence of the haplotype genotype indicates the likely comesence of the haplotype genotype where comesence of the haplotype genotype indicates the likely comesence of the HFE gene mutation in the genome of the individual. The company of the diagnosis and treatment of HFE. The present invention also describes BTF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists come and antagonists of BT function. Also described are: (1) a Roret gene company of the sued to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NFP3 and NFP4 genes similarly be used for hypophosphatemia. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁

The peptide represents an epitope of the human papillomavirus type 1 protein, from amino acids 6-35. This epitope is useful as a target for diagnosis and imaging of HPV-associated cancers, such as invasive cervical cancer. Antibodies raised against this epitope, tagged with cytotoxic molecules, such as cholera toxin, have

                                                          Disclosure; Column 3; 4pp; German.

This invention describes peptides used in a diagnosis kit for testing skin for immune reactions against onco-protein E6 and E7. The method of the invention comprises onco-protein E6 and E7 and/or immunologically active parts of E6 and E7 derived from human papilloma virus.

A CDNA library from the human stromal cell line 295V48, in pwil8s, was screened with an 800 bp fragment derived from conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 20 conserved between two mouse clones, T118 and T110. Approx. 75% homologous to the mouse clones over the first 163 AAs. Clone S86 continued to the mouse clones over the first 163 AAs. Clone S86 continued continued lesser degree, for an overall homology of 668. Clones T118 and Clones after mouse residue 163 (human residue 160). An additiona mouse clone designated M88 has a 29 AA insert at the junction between the common and divergent portions of the mouse ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      # Flt3 ligand; tyrosine kinase receptor ligand; ss Mus musculus.

                                                                                                                                                                                                                                                                              The peptide is the sequence of the human papillomavirus HPV 16 E7 nucleoprotein. Peptides corresponding to regions (pref. epitopic regions) of HPV 16 E7 were synthesised by standard Merrifield synthesis. Examples of such peptides are E7 1-10, 29-50 or 70-81. Compositions conto. these peptides, antibodies against the peptides, or recombinant cells conto. the gene encoding the immunogenic peptides may be utilised in methods for inhibiting and treating HPV prevention or retardation of cervical warts and cervical carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of alpha-D-glucose to beta-D-glucose. This fragment corresponds to amino acids 145-231 of the entire protein. The peptides were generated by digestion with trypsin, chemotrypsin, endopeptidase and Staphylococcus v8 protease. The gene was isolated from a pig kidney cell cDNA lambda library using the probe Q85958. The gene was inserted into the plasmid pBluescript II and transformed into E.coli JM109 for production of the
                                                                                                                                                                                                                                                                                                                                                                                                                         infection

PT papilloma virus - by determining cyclin-dependent kinase activity PT induced by E7 onco-protein
PS Disclosure; Columns 19-20; 14pp; English.

CC E7 oncoprotein. The proliferative state of a cell transformed with CC kinase complexes containing protein papillowing manner. Cyclin/cyclin-dependent CC kinase complexes containing protein palCIPI (W46887-88) are isolated CC from the transformed cell, and the HPV E7 oncoprotein added to the CC isolated protein. Cyclin/cyclin-dependent kinase complexes are isolated CC from an untransformed cell that is substantially homogenic with the CC transformed cell, and the HPV E7 oncoprotein added. The kinase activities of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The method is cused for determining the extent of interaction and/or inactivation CC between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transformed cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

Amino acid sequence of the HPV-16 E7 oncoprotein.
E7 oncoprotein; proliferative state; HPV; kinase activity;
E7 cyclin/cyclin-dependent kinase; p21CIP1; interaction; inactivation;
cyclin/cyclin-dependent kinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            type 4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  variants of E6 and/or E7 protein, pref. deletion mutants, and are used to treat or prevent HPV infection

Example 3; Page 17; 37pp; English.

A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two-thirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 molety fused to a full length E7 molety. The variant optionally has a linkage moicty and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This is a fusion protein of the C-terminal end of E6 and the N-terminal end of E7. The protein is also a deletion mutant generated from the sequence described in T31833.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                             Human Papilloma Virus (HPV) fusion proteins - useful in vaccines for treatment or prophylaxis of HPV induced lesions
Disclosure; Fig 8; 95pp; English.
This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for malignant) and preventing HPV viral infection.

Prot.Dl/3-E7-mut(C24G,E26Q)/HPV16 protein.
Chimeric; E6; E7; fusion protein; protein D; vaccine; immunotherapy; tumour; lesion; benign; mailgnant; virus; infection.
Chimeric - Human papillomavirus.
Chimeric - Haemophilus influenzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antitumour composition containing a therapeutic or prophylactic agent or one or more immunogenic polypeptides, where at least one polypeptide is modified so that its intracellular localisation is different from that of the native polypeptide. This sequence represents an example of a modified immunogenic protein and corresponds to the E7 protein from human papillomavirus fused to the rables virus glycoprotein signal peptide. The compositions, vectors and particles are used to treat or prevent cancers and tumours, specifically those associated with papillomavirus infection (e.g. cancer or low grade dysplasia of the cervix uteri).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (SMIK ) SMITHKLINE BEECHAM BIOLOGICALS.

On Feb 16, 2000 this sequence version replaced gi:6911804.
IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Contig_ID: 00749 Length: 9637bp Contig_ID: 00749 Length: 9637bp Contig_ID: 01824 Length: 9637bp Contig_ID: 01824 Length: 15932bp.
* NOTE: This is a 'working draft' sequence. It currently a consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence as soon as it is available and the accession number will

* be preserved.

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant. The library was produced in an oriented direction, in the pBSII

CC The present invention describes hereditary haemochromatosis gene

CC The present invention describes hereditary haemochromatosis gene. Also described is a

CC method to determine the presence or absence of the common hereditary

CC products from the human haemochromatosis gene. Also described is a

CC method to determine the presence or absence of the common hereditary

CC (a) providing DNA or RNA from the individual; and (b) assessing the

CC DNA or RNA for the presence or absence of a haplotype or genotype where

CC the presence or absence of the haplotype genotype indicates the likely

CC the presence or absence of the haplotype genotype indicates the likely

CC presence of the HFE gene mutation in the genome of the individual. The

CC products for use in the diagnosis and treatment of HFE. The present

CC invention also describes BTF genes, which are homologues of the milk

CC and antagonists of BT function. Also described are: (1) a ROREt gene

CC which can be used to develop products for the study, diagnosis and

CC which are homologues of a type 1 sodium transport gene, and can

CC similarly be used for hypophosphatemia. The present sequence encodes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq_name: N_Geneseq_36:V57910

PT New isolated human sodium-dependent phosphate co:transporter - used PT to develop products for treating e.g. cancers, osteoporosis, PT Alzheimer's disease, diabetes, encephalopathy, myopathy, PT Alzheimer's disease, diabetes, encephalopathy, myopathy, PT Alzheimer's disease, diabetes, encephalopathy, myopathy, PT Nypocalciuria or hypoglycaemia.

PT hypocalciuria or hypoglycaemia.

PT hypocalciuria or hypoglycaemia.

PT Stample V; Page 47; 66pp; English.

CC This sequence represents a fragment of the DNA encoding the human conditions of it can be used to treat or prevent disorders associated conditions of it can be used to treat or prevent disorders associated conditions of it can be used to treat or prevent disorders of concersorosis, familial hypophosphateemia, rickets, cysteneuria, consteoporosis, familial hypophosphateamia, rickets, cysteneuria, consteoporosis, familial hypophosphateamia, rickets, cysteneuria, consteoporosis, familial hypophosphateamia, rickets, cysteneuria, consteoporosis, diabetes mellitus, hereditary amyloidosis, myopathies including consteoporosis, diabetes mellitus, hereditary amyloidosis, myopathies including consteoporosis, encephalopathy, cardiomyopathy, hypokalaemia, Goodpastures considered external ophthalmoplegia, Kearns-Sayre syndrome, myoclonic consteoporosis, and disorders of cell signalling through cAMP, ATP, NADPH and conditional phosphate. Antagonists or inhibitors of NAPTR may be considered to a subject to treat or prevent disorders associated with correcased phosphate levels, e.g. hypocalciuria, hypocalcaemia, and constant of the products can also be used for detection, diagnosis and drug correcation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Align seg 1/1 to:

(a) providing DNA or RNA from the individual; and (b) assessing the

DNA or RNA for the presence or absence of a haplotype or genotype where
the presence or absence of the haplotype genotype indicates the likely
presence of the HFE gene mutation in the genome of the individual. The
products for use in the diagnosis and treatment of HFE. The present
invention also describes BTF genes, which are homologues of the milk
protein butyrophilin (BT), and can be used in the production of agonists
which can be used to develop products for the study, diagnosis and
treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes
which are homologues of a type 1 sodium transport gene, and can
                                                                                                                                                                                                                                                                                                                                                                                                                                                       144 GlyCysValCysCysLeuLeuTrpPhe 152

The present CC invention also describes BTF genes, which are homologues of the milk CC protein butyrophilin (BT), and can be used to develop cc and antagonists of BT function. Also described are: (1) a RoRet gene CC which can be used to develop products for the study, diagnosis and complete treatment of inpus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alignment_scores:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Align seg 1/1 to: V57926

```

present invention describes hereditary haemochromatosis gene

88888888888888888888888888888888

```
PT hypocalciuria or hypoglycaemia.

PS Example V; Page 36; 66pp; English.

CC This sequence represents a PCR primer for the DNA encoding the human CC sodium-dependent phosphate cotransporter (NAPTR) of the invention. NAPTR CC and agonists of it can be used to treat or prevent disorders associated CC with decreased phosphate levels, e.g. cancers of the kidney, disorders of CC decreased phosphate levels including tumoural calcinosis, osteomalacia, CC osteoporosis, familial hypophosphatemia, rickets, cysteneuria, CC nephrocalcinosis, glomerulonephritis, renal calculus, Alzhelmer's CC disease, diabetes mellitus, hereditary amyloidosis, myopathies including progressive external ophthalmoplegia, Kearns-Sayre syndrome, myoclonic CC epilepsy, encephalopathy, cardiomyopathy, hypokalaemia, Goodpastures cc syndrome, and disorders of cell signalling through cAMP, ATP, NADPH and CC glucose-6-phosphate. Antagonists or inhibitors of NAPTR may be CC administered to a subject to treat or prevent disorders associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           alignment_block:

(C) (a) providing DNA or RNA from the individual; and (b) assessing the DNA or RNA for the presence of a haplotype or genotype where the presence or absence of the haplotype genotype indicates the likely presence of the HFE gene mutation in the genome of the individual. The HFE gene sequences from the present invention can be used to develop products for use in the diagnosis and treatment of HFE. The present invention also describes BFF genes, which are homologues of the milk protein butyrophilin (BT), and can be used in the production of agonists and antagonists of BF function. Also described are: (1) a RoRet gene which can be used to develop products for the study, diagnosis and treatment of lupus and Sjogren's syndrome; and (2) NPT3 and NPT4 genes which are homologues of a type 1 sodium transport gene, and can consider the study be used for hypophosphatemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Align seg 1/1 to:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Percent Similarity:

ET-1 and ET-2 were isolated from rat kidneys and their amino acid

ET-1 and ET-2 were isolated from rat kidneys and their amino acid

ET-1 and ET-2 were isolated from rat kidneys and their amino acid

ET-1 and ET-2 were isolated from rat kidneys and their amino acid

ET-2 were isolated from rat ET cDNA (Q14338) was obtd.

Dy screening a rat kidney cDNA library in lambda gt10 with PCR

generated ET probes. These probes were also used to obtain the mouse

ET gene (Q14340) from a mouse T-cell genomic library.

ET DNA was also obtained from human sources (Q14339).

An anti-sense ribonucleic acid molecule complementary to the

indicated fragment in the features is also claimed.

ET-1 is a bifunctional growth regulator, capable of stimulating

the growth of some cell types while inhibitory the growth of others.

ET-2 is functionally similar to ET-1 w.r.t. growth inhibitory

bioactivity. In contrast, however, ET-2 is apparently not capable of

eliciting the growth stimulatory activity characteristic of ET-1 and,

in fact, antagonises this ET-1 activity.

C This human cDNA sequence includes a coding region for GP88 (see 20 W85474), an 88 kbg glycoprotein autocrine growth factor and epithilin/granulin precursor that is expressed in a tightly compared to the precursor of the precursor that is expressed and unregulated in highly tumorigenic cells derived from normal cells, and which compared the cells. Inhibition of GP88 expression or action in the tumorigenic cells. Inhibition of GP88 expression or action in the cumorigenic cells results in an inhibition of the tumorigenic cells results in an inhibition of the tumorigenic cells are cust of the overproducing cells. Antagonists to GP88 are used to treat diseases associated with increased expression of GP88 particularly cancer but also viral infections. Fragments of CC GP88 are used to raise specific antibodies (used as antagonists, CC as diagnostic reagents and for delivering toxins or other compounds to GP88 expressing cells) and to screen for antibodies. CC Methods are provided for diagnosing disease, or determining cusceptibility to disease, resulting from altered GP88 activity.

New cystine rich granulin peptide(s) from leucocyte(s) - keratinocyte inhibitors useful topically for wound healin Disclosure; Figure 4C; 53pp; English.

The granulin inhibits keratinocytes and is useful in form for promoting the healing of wounds.
